GLOBAL SETUP
python-setup
start the Python interpreter and import libraries
global variables
create and initialize the globals of the model
SETUP
rate-and-parameter-setup
capture the values entered by the experimenter
create agents and links
place agents in S, E, D, U and build the network
cyber-risk-approach-calculation
compute the maritime cyber risk model
python-state-update
transfer initial conditions and parameters
GO — one simulation step
cyber-risk-approach-calculation
recompute the risk model for the step
python-equation-solver
integrate the update function (RK45) and round
node-graph-distribution-solution
allocate the aggregate change over admissible transitions
node-graph-distribution-update
apply the resulting moves to individual agents
outputs and stopping conditions
update displays; stop or advance one step
next simulation step
Executed in NetLogo
Executed in Python
